

**REGRANULATE**

**High-grade regranulate  
for innovative  
plastic ideas**

# Regranulate & Compound

## The starting material

As the starting material for our regranulates mainly PE from used plastics and the collections of the „Green Dot“ are used.

## Treatment

The PE materials are washed and treated to produce agglomerates. Subsequently these are processed to form regranulates.

## The granulates

The result of the process technologies further developed by ourselves is constantly high-grade raw materials such as regranulate and compound.

## The innovative end products

From regranulates high-grade end products are produced. Whether in the case of plastic parts in the automotive industry or for items of every-day use, everywhere regranulates play an important part as raw materials.

**We upgrade !**

# High-grade regranulate for innovative plastic ideas

## high type-purity

### by means of further-developed production processes

By means of our own constant further development of our washing and production processes in our production facilities our regranulates have a very high type-purity.

## individual regranulates

### for individual requirements

We produce our regranulates depending on the requirement, starting from lower quality stages up to the highest grade raw materials. By means of the introduction of additives our regranulates are imparted completely new material properties. In that way you receive exactly the raw material which you need for your „plastic idea“.

## constant high quality

### as a result of certified production

By means of adherence to strict production standards we guarantee a constant high quality of our regranulates. This gives you the certainty that your end product is not subject to any quality variations, either.
